1. Abstract

We study the family of elliptic curves $y^2 = x(x - a^2)(x + b^2)$, where (a, b, c) are Pythagorean triples. This is the family of the Frey curves of degree 2. We can 1-parameterize Pythagorean triples by rational numbers and consider the family as an elliptic curve over a function field.

$$E_{1,s} : y^2 = x(x - 4s^2)(x + (s^2 - 1)^2) \quad (1.1)$$

It is known that the generic rank of the Mordell-Weil group of $E_{1,s}$ over $\overline{\mathbb{Q}}(s)$ is 0. We found an infinite subfamily of $E_{1,s}$ whose Mordell-Weil group has positive rank over $\overline{\mathbb{Q}}(s)$, which means that there are infinitely many Pythagorean triples (a, b, c) such that the Frey curve $y^2 = x(x - a^2)(x + b^2)$ has positive rank. **TODO: $\mathbb{Q}(s)$ 上でランク正の無限族じゃないと, Frey curve が無限個とはいえない** Each elliptic curve over a function field corresponds to an elliptic surface. We prove that the Mordell-Weil group of the subfamily has exactly rank 1 over $\overline{\mathbb{Q}}(s)$ using the theory of elliptic surfaces.

2. Introduction

2.1 セクション

Theorem 2.1.1. Let

$$E_{1,s} : y^2 = x(x - 4s^2)(x + (s^2 - 1)^2) \quad (2.1)$$

be an elliptic curve over $\overline{\mathbb{Q}}(s)$. Then, the Mordell-Weil group

$$E_{1,s}(\overline{\mathbb{Q}}(s)) \cong \mathbb{Z}/4\mathbb{Z} \oplus \mathbb{Z}/4\mathbb{Z}, \quad (2.2)$$

especially the rank is 0. The torsion subgroup is generated by

$$T_1 := (2s(s+1)^2, 2s(s+1)^2(s^2+1)), \quad (2.3)$$

$$T_2 := (2is(s^2-1), 2is(s+i)^2(s^2-1)). \quad (2.4)$$

Corollary 2.1.2.

$$E_{1,s}(\mathbb{Q}(s)) \cong \mathbb{Z}/2\mathbb{Z} \oplus \mathbb{Z}/4\mathbb{Z} \quad (2.5)$$

is generated by T_1 and $2T_2 = (0, 0)$.

Theorem 2.1.3.

$$E_{4,t} : y^2 = x(x - 4s^2)(x + (s^2 - 1)^2), s = \frac{2t}{t^2 - 3} \quad (2.6)$$

は

$$\left(s^2 - 1, \sqrt{-1}s(s^2 - 1) \frac{t^2 + 3}{t^2 - 3} \right) \quad (2.7)$$

を通る.

$$1 \leq \text{rank } E_{4,t}(\overline{\mathbb{Q}}(t)) \leq 2 \quad (2.8)$$

3. Preliminaries

In order to get the lower bound of the rank of the Mordell-Weil group, we can just find points of infinite order. It is more difficult to get the upper bound of the rank. The following theorem behaves a key role in the proof of the main theorem.

Theorem 3.0.1. (Shioda-Tate formula, [1] Theorem 3.4)

$$\rho(S) = 2 + \sum_{v \in R} (m_v - 1) + \text{rank}(E(K)) \quad (3.1)$$

である.

Theorem 3.0.2. rational や K3 のときの ρ はわかっている.

In order to make it easier to calculate the rank, we can use the following theorem.

Theorem 3.0.3. ([1] Proposition 4.1.)

$$\text{rank } E(k(C)) + \text{rank } E^{(u)}(k(C)) = \text{rank } E(k(C)(\sqrt{u})) \quad (3.2)$$

However, Theorem 3.0.2 is still not enough to get the upper bound of the rank in our case.

5.1 セクション

Theorem 5.1.1.

$$E_{4,t}(\overline{\mathbb{Q}}(t))_{\text{tors}} = \mathbb{Z}/4\mathbb{Z} \times \mathbb{Z}/4\mathbb{Z} \quad (5.1)$$

$$T_1 = (2s(s+1)^2, 2s(s+1)^2(s^2+1)) \quad (5.2)$$

$$T_2 = (2is(s^2-1), 2is(s+i)^2(s^2-1)) \quad (5.3)$$

で生成される.

証明

$$E_{4,t}(\overline{\mathbb{Q}}(t))[2] = E_{1,s}(\overline{\mathbb{Q}}(s))[2] = \{O, (0,0), (4s^2,0), (-(s^2-1)^2,0)\} \quad (5.4)$$

$$2T_1 = (4s^2, 0) \quad (5.5)$$

$$2T_2 = (0, 0) \quad (5.6)$$

[1] の Lem.3.5 より

$$E_{4,t}(\overline{\mathbb{Q}}(t))_{\text{tors}} \hookrightarrow (\mathbb{Z}/4\mathbb{Z})^{12} \quad (5.7)$$

Remark 5.1.2. これは
